

Project Report: AI Medical Chatbot using IBM Watson API

Name: Rupak

Reg. No.: 22BCE10127

VIT Mail ID: rupak2022@vitbhopal.ac.in

Github repo of project: <https://github.com/rupakghanghas/ibm-chatbot>

1. Project Title

AI-Powered Medical Chatbot using IBM Watson API

2. Abstract

This project involves developing a medical chatbot using IBM Watson Assistant to provide intelligent, real-time support for healthcare-related queries. The chatbot assists users by answering health-related questions, suggesting possible conditions based on symptoms, providing general medical advice, and helping users navigate healthcare resources. The use of IBM Watson's advanced natural language processing capabilities ensures a scalable and reliable digital health assistant.

3. Summary of Work Done

Phase 1 – Proposal and Idea Submission (10 Marks):

We identified the need for a virtual medical assistant to support users with general healthcare queries. The project objectives were:

- Understand the scope and application of AI-driven conversational systems in healthcare.
- Use IBM Watson Assistant to design intents, entities, and dialog specific to the medical domain.
- Integrate the chatbot with a website for user interaction.

A detailed proposal was submitted including problem definition, goals, required tools, and the expected outcome tailored to a healthcare chatbot.

Phase 2 – Execution and Demonstration (15 Marks):

In this phase, the chatbot was built using IBM Watson Assistant and integrated into a sample health support website. Completed tasks include:

- Created a new assistant named **Medical Support ChatBot**.
- Defined intents such as symptoms inquiry, general health tips, and doctor suggestions.
- Created entities like @symptom, @body_part, @disease to recognize user input.
- Built a structured dialog tree for tailored responses.
- Published the assistant and generated integration code.
- Embedded the chatbot on the website for real-time interaction.
- Tested the chatbot using real-world scenarios to ensure accuracy.

GitHub Link: [Replace with your GitHub repo]

4. Project Architecture Components

- **User Interface:** Embedded chat interface on the medical support website.
 - **Watson Assistant:** Handles intents, entities, dialog management, and responses.
 - **Backend (optional):** Could integrate with APIs for doctor listings, health articles, etc.
-

5. Features Implemented

- **Symptom-based Query Handling:** Users can ask about symptoms and get possible conditions.
 - **First-Aid Information:** Provides general guidance for common emergencies.
 - **Health Tips:** Offers preventive care suggestions.
 - **Doctor/Clinic Search:** Suggests nearby medical facilities (planned for future).
 - **FAQ Resolution:** Covers common questions like diet, vaccinations, mental health.
 - **Fallback & Handoff:** Escalates to a human or provides emergency contact info if needed.
-

6. IBM Watson Configuration

- **Create Watson Assistant Service**
 - **Define Intents** (e.g., symptoms_check, general_advice)
 - **Define Entities** (e.g., @symptom, @body_part)
 - **Create Dialog Flow**
 - **Preview and Publish**
 - **Website Deployment**
-

7. Integration with Website

- Watson Assistant deployed via embedded code snippet.
 - Chatbot launches automatically or on clicking a chat icon.
 - UI customized to match medical site aesthetics.
-

8. Testing Phase

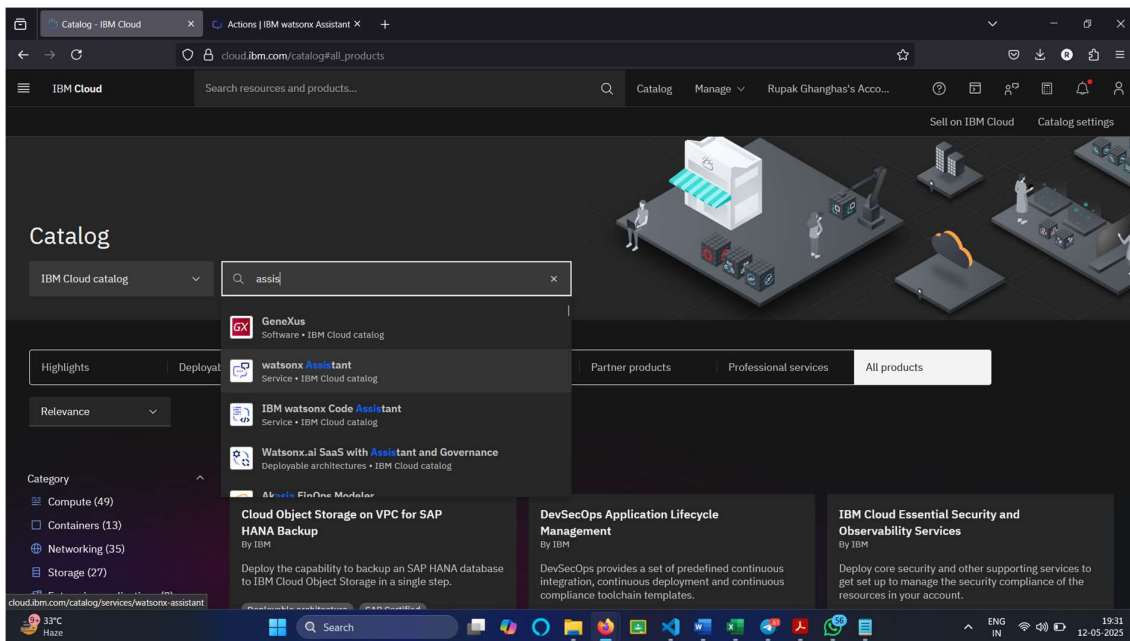

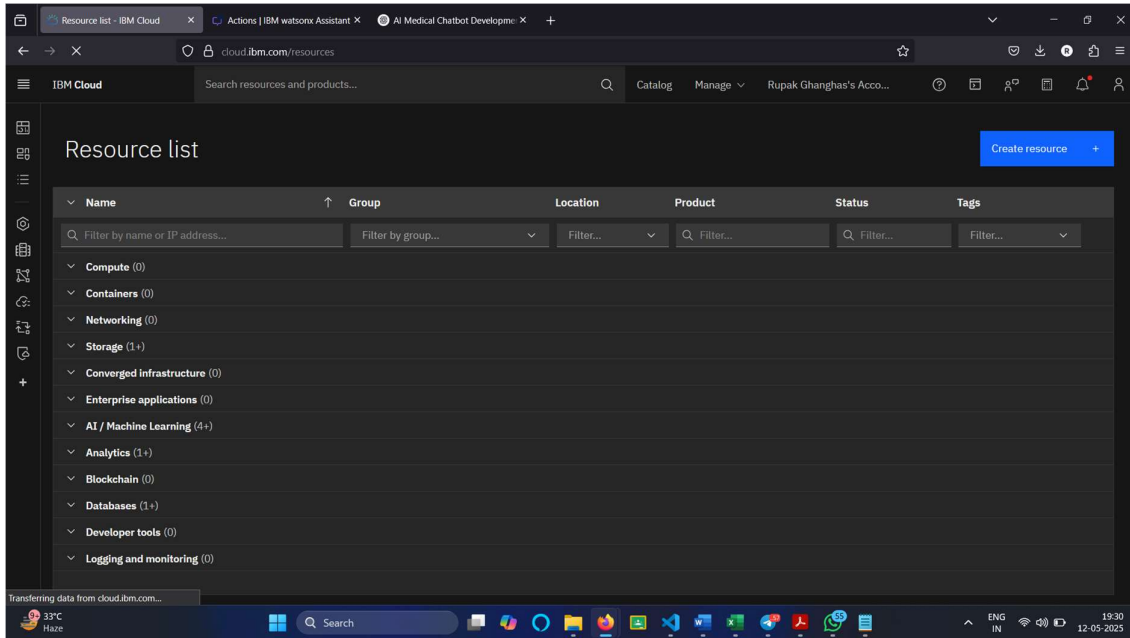

8.1 Testing Strategy

Testing included multiple use cases and both manual and automated methods:

- **Input Handling:** Tested with diverse query formats.
- **Context Understanding:** Checked coherence across multi-turn conversations.
- **Edge Cases:** Handled vague or unrelated input effectively.

8.3 Challenges Faced

- Mapping user symptom descriptions to intents.
 - Handling multi-symptom or ambiguous health queries.
 - Managing limitations of static data without live backend integration.
-

Examples: access:dev, proj:version-1

Actions:

- up to 30 assistants included
- Share log and analytics data across instances
- Keep usage and training data private in an isolated single tenant environment
- HIPAA Enabled in Washington DC (US-East) & Dallas (US-South)
- Limits ---
- Actions:
- 30 assistants per instance
- Up to 2,000 actions per instance
- 100 custom extensions per assistant
- 90 days of usage analytics
- Session inactivity timeout 7 days
- 1,000 concurrent calls using phone integration (contact us for higher limits)
- Dialog
- Same as Enterprise
- EU Supported available in Frankfurt (EU-DE)
- 12 month commitment required

9. Future Enhancements

- Integrate with live medical databases or APIs.
- Enable voice interface for easier access.
- Add multilingual support via Watson Language Translator.
- Include visuals (diagrams, icons, basic anatomy images).

- Add appointment scheduling and emergency support features.

10. Conclusion

The AI medical chatbot powered by IBM Watson delivers quick, intelligent health-related assistance. It offers a scalable solution to support basic healthcare queries and helps reduce load on medical professionals by handling common questions, setting the stage for more advanced digital health services.
